The present sequence is S. goldeniensis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycel in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antiblotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, immunosuppressive antiparaine agents, bioinsecticides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SsgA. liquid culture; filamentous bacteria; secondary metabolite; mycelium; antibiotic, antitumour agent; immunosupressive agent; mypocholesterolaemic agent; enzyme inhibitor; antimigraine agent; herbicide; antiparasitic agent; ruminant growth promoter; bioinsecticide; receptor agonist; antagonist; blomass.

                                                                                                                                           ó
bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is S. netropsis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents,

This sequence is a H. pylori cellular protein.

The protein may be used in a vaccine to prevent or treat H. pylori cellular protein.

The protein may be used in a vaccine to prevent or treat H. pylori for the cycle activators or inhibitors. The useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of H. pylori in sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (APCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for one of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli

The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,
                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                           AAB96082;

                                                                                                                                                                                                                                                                                                                                                             ANH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the september of vectors on taining them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides may also be used to assay for other inhibitors of their The polypeptides may also be used to assay for other inhibitors of their creatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA AAH55090 represent oligonucleotide sequences from the present invention. AAH55091 to AAH55090 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAR6431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade.
                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: This patent is in the same patent family as WO200055062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436.

polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the treatment, prevention and diagnosis of medical conditions caused by a canes. The groteins and diagnosis of medical conditions caused by pertosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and diagnostic agents for determining P. acnes in the antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to nucleic acids (e.g., AAC87518, AAC87519) which encode Trametes hirsuta pyranose oxidase (AA448832). The invention also relates to expression constructs, expression vectors and recombinant cells comprising pyranose oxidase nucleic acid sequences, and the recombinant production of Trametes hirsuta pyranose oxidase. Pyranose oxidase catalyses the oxidation of several monosaccharides in the pyranose form at position C2 to produce 2-keto derivatives with the release of hydrogen peroxide. Nucleic acids encoding Trametes hirsuta pyranose oxidase may be used to produce the enzyme and to design oligonucleotide probes to identify and clone genomic pyranose oxidase cDNA or genomic DNA from different genera or species of microorganisms
                                                                                                                                                                                                                                                                                             211 qiyystadgvderddvelptdahthmswafskpgvykavfaa----tlstpqgnasfga 265

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically the proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to home as a stem cell proliferation; to regulate hammatopoiesis; and in the process the cell proliferation; to regulate hammatopoiesis; and in the process the cell proliferation; to regulate hammatopoiesis; and in the process of the proliferation; to regulate hammatopoiesis; and in the process of the proliferation; to regulate hammatopoiesis; and in the process of the proliferation; to regulate hammatopoiesis; and in the process of the proliferation; to regulate hammatopoiesis; and in the process of the proliferation; to regulate hammatopoiesis; and in the process of the proliferation; to regulate hammatopoiesis; and in the process of the proliferation; to regulate hammatopoiesis; and in the process of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy \cdot

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to ovalicin and fumagillin derivatives that can inhibit type 2 methionine aminopeptidase (MetAP2). These inhibitors are useful for treating and/or diagnosing diseases involving abnormal angiogenesis (e.g. tumours, diabetic retinopathy, inflammatory diseases, arteriosclerosis) or immune reactions which result in pathology (e.g. autoimmune disease, allergy and tissue graft rejection). The present sequence represents the amino acid sequence of rat MetAP2.

Patent No. 6207704
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Liu, Jun O.
APPLICANT: Su, Zhuang
TITLE OF INVENTION: Type 2 Methionine Aminopeptidase (MetAP2) Inhibitors
TITLE OF INVENTION: and Uses Thereof
FILE REFERENCE: 0492611-0346
CURRENT PELLOM NUMBER: US/09/093,448A
CURRENT FILING DATE: 1998-06-08
NUMBER OF SEQ ID NOS: 4
SOUTHWARE: Patentin Ver. 2.0

hexokinase (EC 2.7.1.1) 1 - fission yeast (Schizosaccharomyces pombe)
N.Alternate names: protein SPAC24H6.04
C.Specias: Schizosaccharomyces pombe
C.Specias: Schizosaccharomyces pombe
C.Date: 15-Feb-1997 #sequence_revision 13-Mar-1997 #text_change 20-Jun-2000
C.Accession: $68694; T38360; $62406
R.Petit, T.: Blazquez, M.A.; Gancedo, C.
FEBS Lett. 378, 185-189, 1996
A:Title: Schizosaccharomyces pombe possesses an unusual and a conventional hexokinase
A:Reference number: $68693; MUID:96140736
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A.Cross-references: EMBL:254142; NID:9984697; PIDN:CAA90848.1; PID:9984701; GSPDB:GNO A.Experimental source: strain 972h-; cosmid c24H6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 COFACTOR: COBALT; BINDS 2 IONS PER SUBUNIT (By similarity). PTM: CONTAINS 12 O-LINKED GLCNAC. SIMILARITY: BELONGS TO PEPTIDASE FAMILY M24C; ALSO KNOWN AS THE MAP FAMILY 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PROTEINS.
FUNCTION: PROTECTS EIF-2 ALPHA-SUBUNIT FROM INHIBITORY
PHOSPHORYLATION BY EIF-2 KINASES. PLAYS A CRITICAL ROLE IN THE
REGULATION OF PROTEIN SYNTHESIS. IT ALSO INTERACTS WITH THE
EIF-2 GAMMA-SUBUNIT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CATALYTIC ACTIVITY: L-METHIONYLPEPTIDE + H(2)0 = L-METHIONINE + PEPTIDE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=95372350; PubMed=7644482; Meaver L.H., Stewart A.E., Aaffin S.M., Kendall R.L., Hall L., Weaver L.H., Stewart A.E., Matthews B.W., Bradshaw R.A.; Eukaryotic methionyl aminopeptidases: two classes of cobalt-dependent enzymes." proc. Submitted (APR-1997) to the EMBL/GenBank/DDBJ databases.
FUNCTION: REMOVES THE AMINO-TERMINAL METHIONINE FROM NASCENT PROTEINS (BY SIMILARITY).
FUNCTION: PROTECTS EIF-2 ALPHA-SUBUNIT FROM INHIBITORY PHOSPHORYLATION OF PROTEIN SYNTHESIS, IT ALSO INTERACTS WITH THE EIF-2 GAMMA-SUBUNIT (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: L-METHIONYLPEPTIDE + H(2)O = L-METHIONINE + PEPTIDE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- COFACTOR: COBALT; BINDS 2 IONS PER SUBUNIT (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29 LTFHLPGDAPVTWVFGRELLVEGVLDAAGD------GDVRVCPVGQTATREVH 75
                                                                                                                          OF ENTEROBACTIN SYNTHESIS.

PATHWAY: ENTEROBACTIN SYNTHESIS.

PATHWAY: ENTEROBACTIN BIOSYNTHESIS. ENTEROBACTIN IS AN IRON-
CHELATING. COMPOUND INVOLVED IN TRANSPORTING IRON FROM THE
BACTERIAL ENVIRONMENT INTO THE CELL CYTOPLASM.

SUBUNT: PROTEINS ENTE, ENTE, BYTE, AND ENTG FORM A MULTIENZYME
COMPLEX CALLED ENTEROCHELIN SYNTHASE.
FUNCTION: ACTIVATION OF THE CARBOXYLATE GROUP OF 2,3-DIHYDROXY-BENZOATE (2,3-DHB), VIA ATP-DEPENDENT PPI EXCHANGE REACTIONS, TO THE ACYLADENYLATE, PREPARING THAT MOLECULE FOR THE FINAL STAGES OF ENTEROBACTIN SYNTHESIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SWA4_MOUSE STANDARD; PRT; 551 AA.

'gene="SCO11.01c" hypothetical protein, partial CDS, len:
'note="SCO11.01c" hypothetical protein, partial CDS, len:
'95 aa; unknown function, previously sequenced as

TR:053870 (EMBL:U37580), S.coelicolor hypothetical protein

ORF5 downstream of phosphotyrosine protein phosphatase
(159 aa). Weak similarity to the N·terminus of TR:06988

(EMBL:AL023797) Streptomyces coelicolor hypothetical

ECD:0.00036, 46.2% identity in 65 aa overlap. Continues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           http://www.nih.go.jp/
jun/Gqi-bin/frameplot.pl. CAUTION: We may not have predicted the
jun/Gqi-bin/frameplot.pl. or correct initiation codon. Where possible we choose an initiation
codon (atg, gtg, ttg or (att)) which is preceded by an upstream
ribosome binding site sequence (optimally 5-13bp before the
initiation codon). If this cannot be identified we choose the most
upstream initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /translation="mrvrpvvkrtararavLLDGDHLILIKRTKPGVDPywvrpGGGVEP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

The length in codons is given for each CDS.

The highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markow Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (URL; http://www.sanger.ac.uk/Projects/S_coelicolor/)
CDS are numbered using the following system eg SC7B7.01c. SC (S. coelicolor), 7B7 (cosmid name), .01 (first CDS), c (complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Streptomyces coelicolor sequencing at The Sanger Centre is funded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ದ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for small overlap between neighbouring submissions.

Cosmid Q11 Cosmid Q11 lies between H24 and D78 on the AseI-Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       by the BBSRC and Beowulf Genomics

```
transcriptional regulator, len: 301 as; previously sequenced as TR:053869 (EMBL:037580) S.coelicolor lysR-like protein (301 aa). Highly similar to SW:ARAB_STRAT (EMBL:037580), arab, Streptomyces antibioticus transcriptional regulatory protein (301 aa), fasta socres; opt: 1581 z-score: 1813.2 E(::0, 80.3% identity in 300 aa overlap. Similar to many other transcriptional regulators. Contains probable helix-turn-helix motif at aa 17-38 (Score 1659, 44.84 SD). Contains Pfam match to PF00126 HTM_1, Bacterial regulatory helix-turn-helix protein, lysR family and PS00004 Bacterial regulatory proteins, lysR family signature"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /translation="MOLALIRTFVTVHRAGSFTRAAALLGLSQPAVTSQIRTLERQLG
